

M. Tech: POWER ELECTRONICS

Department of Electrical & Electronics Engineering

B. M. S. College of Engineering

Proposed Scheme & Syllabus

2020-2021

PROGRAM OUTCOMES: JULY 2017 (Defined by NBA)

PO1: An ability to independently carry out research /investigation and development work to solve practical problems.

PO2: An ability to write and present a substantial technical report/document.

PO3: Students should be able to demonstrate a degree of mastery over the area as per the specialization of the program. The mastery should be at a level higher than the requirements in the appropriate bachelor program.

PROGRAM EDUCATIONAL OBJECTIVES

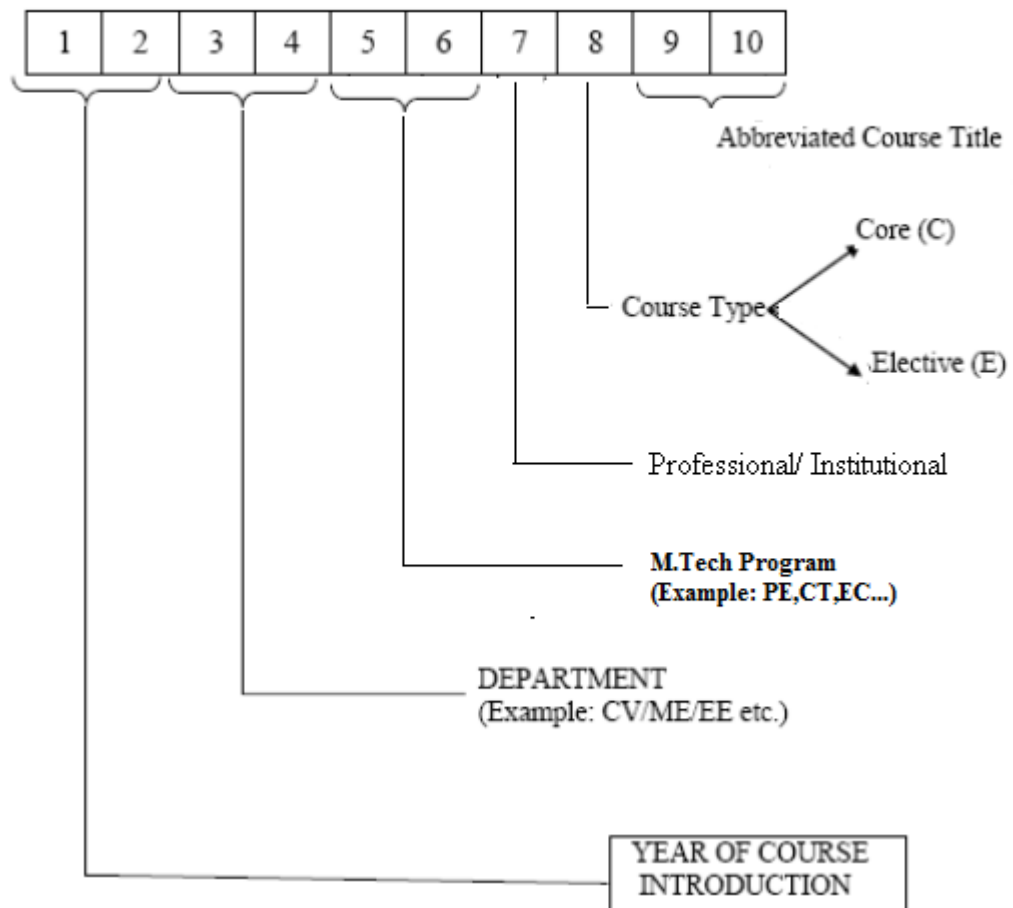

Graduates of the M. Tech Power Electronics Program will,

1. Excel professionally in Power Electronics and allied domains.
2. Undertake research and development that addresses technological requirements of Industry and Institutes of higher learning.
3. Adapt to the changing needs of Industry/Society through lifelong learning.

CREDIT SUMMARY

Sem.	PCC	PEC	ICC	IEC	Internship	Project phase I / Final Project	Technical Seminar	Total
I	14	6	2	-	-	-	-	22
II	12	6	-	4	-	-	-	22
III	-	4	-	-	10	8	-	22
IV	-	-	-	-	-	20	2	22
Total	26	16	2	4	10	28	2	88

NOMENCLATURE FOR THE COURSE CODE

I Semester

Course Type	Code	Course Title	Credits				Marks

Audit Course-II	20EEPEPAC2	(Non-technical course)	-	-	-	-	-	-	-
TOTAL			0	0	22	22	100	100	200

Percentage compliance to AICTE Model: 55 % (Core + Elective courses+IC+IE)

: 45 % (Internship + Project work + T. Seminar)

Percentage compliance to VTU Curriculum:

VTU curriculum structure:

: 57% (Core +Elective courses)

: 43% (Internship+Projects+Seminar)

	Core courses	Elective courses	ICC	IEC	Seminar	Internship	Project	Total credits	% Core (Core+IC)	% Elective (Elective)	% Project + Internship
VTU syllabus	40	09	--	--	02	20	14	85	47%	10%	43%
Autonomous	26	16	02	04	--	11	29	88	32%	23%	45%

The percentage core courses in VTU curriculum is comparatively higher with respect to autonomous curriculum. Percentage of Elective courses offered in proposed PG curriculum is comparatively higher with respect to VTU curriculum to provide an opportunity for students to select elective courses based on their area of interest.

The overall percentage for internship and project for both curriculum is almost same.

Contribution from other departments : Mathematics (3-0-0)

MBA (4-0-0)

SYLLABUS

I SEMESTER

Subject	APPLIED MATHEMATICS	Sub-code	20EEPEBSMT
Credits	03	L-T-P	3-0-0

Course Outcomes: At the end of the course student will be able to:

CO1: Apply the concepts of solving polynomial equations, transcendental equations, ordinary differential equations, partial differential equations, system of algebraic equations and non-linear equations for Engineering problems.

CO2: Apply the concepts of graph theory, eigen value problems, interpolation and Optimization to deal with projects.

Unit 1: Numerical Methods: Solution of algebraic and transcendental equations:- Chebyshev method, general iteration method, acceleration of convergence, iterative methods based on second degree equation–Muller method, system of non-linear equations and complex roots - Newton-Raphson method, solution of ordinary differential equations - Numerov method. Polynomial equations:- Birge – Vieta method and Bairstow’s method.

Unit 2: Numerical Solution of Partial Differential Equations: Classification of second order equations, parabolic equations- solution of one - dimensional heat equation, explicit method, Crank-Nicolson method and Du Fort-Frankel method, hyperbolic equations- solution of one - dimensional wave equation.

Unit 3: System of Linear Algebraic Equations: Iterative methods - Gauss-Seidal method, Relaxation method, **Eigen value problems:** Eigen values and Eigen vectors of real symmetric matrices - Jacobi method, Givens method. **Interpolation:** Hermite interpolation, Spline interpolation.

Unit 4: Graph Theory: Basic terminologies, types of graphs, sub graphs, graphs isomorphism, connected graphs-walks, paths, circuits, connected and disconnected graphs, operations on graphs, Eulerian paths and circuits, Hamiltonian paths and circuits, applications of graphs.

Unit 5: Optimization: Linear Programming - Introduction, Formulation of the problem, Graphical method, General Linear programming problem, Standard form of LPP, Simplex method, Artificial variable technique – M-method.

Text Books:

1. M K Jain, S R K Iyengar and R K Jain, “Numerical Methods for Scientific and Engineering Computations”, New Age International Publications, 6th Edition, 2012.
2. B.S. Grewal, “Higher Engineering Mathematics”, Khanna Publishers, 43rd Edition, 2015.
3. Narsingh Deo, “Graph Theory with Applications to Engineering and Computer Science”, PHI, 2012.
4. Steven C. Chapra and Raymond Canale, “Numerical methods for Engineers”, McGraw-Hill Education, 7th Edition, 2014.

Subject	POWER SEMICONDUCTOR DEVICES	Sub-code	20EEPEPCPS
Credits	03	L-T-P	3-0-0

Course outcomes:

CO1: Apply knowledge of physics of semiconductor and electronic devices to develop Describe, analyze characteristics and compare various types of power semiconductor devices to control power electronic systems.

CO2: Identify and prioritize the use of power devices along with the concept of thermal design for various power electronic equipment's in various power electronic systems and control applications.

CO3: Develop skills and apply the principles to explore the possibility of emerging power semiconductor devices in different areas and prepare a technical report.

Unit 1: Power Diodes: Basic Structure and I-V Characteristics. Breakdown Voltages and Control. On State Losses, Switching Characteristics. Turn on Transient. Turn off Transient. Reverse Recovery Transient. Schottky Diodes. Snubber Requirements for Diodes and Diode Snubbers. Modelling and simulation of Power Diodes. Numerical problems.

Unit 2: Thyristors:

a)Thyristors: - Basic Structure. V-I Characteristics. Turn on Process. On State operation. Turn off process, Switching Characteristics .Turn on Transient and di/dt limitations. Turn off Transient. Turn off time and dv/dt limitations. Ratings of Thyristors. Snubber Requirements and Snubber Design. Modeling and simulation of Thyristors. Numerical problems.

b)Gate Turnoff Thyristor (GTO): Basic Structure and Operation. GTO Switching Characteristics. GTO Turn on Transient. GTO Turn off Transient Minimum ON and OFF State times .Maximum Controllable Anode Current Overcurrent protection of GTOs Modeling and simulation of GTOs.

Unit 3: Transistors:

a)Power BJTs: . Basic Structure and I-V Characteristics, Switching Characteristics.

b)MOSFETs - Basic Structure . V-I Characteristics. Turn on Process. On State operation. Turn off process. Switching Characteristics Resistive Switching Specifications. Clamped Inductive Switching Specifications - Turn on Transient and di/dt limitations. Turn off Transient Turn off time. Switching Losses. Effect of Reverse Recovery Transients on Switching Stresses and Losses - dv/dt limitations. Gating Requirements Gate Charge -

Ratings of MOSFETs. FBSOA and RBSOA Curves. Device Protection -Snubber Requirements. Modelling and simulation of Power MOSFETS. Applications of MOS devices. Numerical problems.

c)Insulated Gate Bipolar Transistors (IGBTs):. Basic Structure and Operation .Latch up IGBT Switching Characteristics. Resistive Switching Specifications. Clamped Inductive Switching Specifications - IGBT Turn on Transient. IGBT Turn off Transient- Current Tailing. FBSOA and RBSOA Curves. Switching Losses - Minimum ON and OFF State times - Switching Frequency Capability - Overcurrent protection of IGBTs . Short Circuit Protection. Snubber Requirements and Snubber Design. Applications of IGBT. Numerical problems.

Unit 4: Thermal design of power electronic equipment:

Heat transfer by conduction, transient thermal impedance - heat sinks .Heat transfer by radiation and convection - Heat Sink Selection for Power Semiconductor Devices.

Unit 5: Emerging Trends:

New power semiconductor devices: MOS Gated Thyristors, MOS Controlled Thyristors, emitter turn-off thyristor (ETOs), Integrated Gate Commutated Thyristor (IGCT), Static induction transistor (SIT), Emitter Switched Thyristor. Silicon Carbide, Power Integrated Circuits, New Semiconductor Materials for Power Devices

Subject	SOLID STATE POWER CONVERTERS	Sub-code	20EEPEPCSP
Credits	04	L-T-P	3-0-1

Course outcomes:

CO1: Analyze and evaluate the performance of AC- DC, DC-DC, AC-AC and DC-AC converters in all the modes of operation.

CO2: Analyze and evaluate different PWM schemes for voltage control and harmonic reduction in inverters.

CO3: Conduct experiment / simulation studies on single phase and three phase power electronic converters and write a report.

Unit 1: Line Commutated Converters: Phase control, single phase semi-converter & fully controlled converter, Performance Parameters, three phase semi controlled & fully controlled converter, dual converters, power factor improvement methods, effect of source inductance, twelve pulse converter and design of converter circuits.

Unit 2: Inverters: Principle of operation, performance parameters, single phase bridge inverters and three phase inverters. Voltage Control of Single Phase Inverters: Single/multiple, pulse/SPWM/ modified SPWM methods, voltage control of three phase inverter, SPWM/third harmonic PWM/Space vector modulation, harmonic reduction, current source inverter, comparison between VSI & CSI.

Unit 3: Multilevel Inverters: Introduction, types, diode clamped, flying capacitor, cascaded multilevel inverters, features & applications.

Unit 4: DC-DC Converters: Principle of operation, analysis of step-down and step-up converters, classification of chopper & chopper circuit design.

AC-AC Converters: AC Voltage Controllers, Cyclo-converters, matrix converters

Unit 5: Applications of Power Converters: Residential Applications- Space heating and air conditioning, high frequency fluorescent lighting, induction cooking, Industrial Applications- Induction Heating, Electric Welding, Interconnection of renewable energy sources and Energy Storage Systems to Utility grids.

Lab experiments:

Experimental and simulation studies on

- Converters

- Inverters and
- Choppers

Subject	MODELING AND SIMULATION OF POWER ELECTRONIC SYSTEMS	Sub-code	20EEPEPCMS
Credits	04	L-T-P	3-0-1

Course outcomes:

CO1: Apply mathematical skills and modelling methods to represent a physical system.

CO2: Design, develop and analyze the performance of digital controllers and various Power Electronics circuits.

CO3: Develop various Power Electronics circuits using modern engineering software tools and prepare a technical report.

Unit 1: Modeling of Systems: Input-Output relations, differential equations and linearization, state space representation, transfer function representation, modeling of an armature controlled DC Motor, poles and zeroes circuit averaging method of modelling approach for switched power electronic circuits, space vector modeling, space vectors, representation of space vectors in orthogonal co-ordinates, space vector transformations, modeling of induction motor, state space representation of the d-q model of the induction motor.

Unit 2: Control System Essentials: Representation of system in digital domain, Z transform, Mapping between s- plane and Z- plane, Continuous to Discrete domain conversion, Hold equivalence

Unit 3: Digital Controller Design: Controller design techniques, Bode diagram method, PID controller, design, root locus method, state space method. Tracker, controller design, controlling voltage, controlling current.

Unit 4: Discrete Computation Essentials: Numeric formats, fixed -point numeric format, floating -point numeric format, tracking the base point in the fixed point system, addition of numbers, subtraction of numbers, multiplication of numbers, normalization and scaling, multiplication algorithm, arithmetic algorithm reciprocal, square root, reciprocal of square root, sine and cosine exponential, logarithm.

Unit 5: Implementation examples: PI controller, sine and cosine, pulse width modulation, space vector PWM, over-modulation.

Lab experiments:

- Modeling using state space representation, transfer function representation of a system.

- Modeling of an armature controlled DC motor
- Modeling of a Buck converter
- Three phase to two phase transformations
- Modeling of three phase Induction motors
- Controllers design techniques – Bode and root locus method
- PID controllers for voltage and current control

ELECTIVE - I

Subject	DIGITAL MEASUREMENTS	Sub-code	20EEPEPEDM
Credits	03	L-T-P	3-0-0

Course outcomes:

CO1: Realize the significance of digital based measurements using Microprocessor/Microcontroller.

CO2: Analyze time and frequency measurement techniques and apply the knowledge for the design of various circuits.

CO3: Realize and design different D/A converters.

CO4: Design A/D converters and apply the concept of voltage measurement technique for various systems.

Unit 1: Philosophy of digital and microprocessor/microcontroller based instruments.

Unit 2: Time measurement techniques: measurement of time interval between events, Order of events, Vernier technique, very low time, period, phase time constant, Capacitance measurements, decibel meter.

Unit 3: Frequency measurement techniques: frequency ratio and product, high and low frequency measurements, deviation meter, tachometer, peak/valley recorder.

Unit 4: DACs: programmable amplifier as DACs, multistage WRDACs, weighted current, weighted reference voltage, weighted charge, DACs, ladder DACs, design of DACs with respect to spread and total resistance, hybrid multiplier and divider Circuits

Unit 5: Voltage measurement techniques: V/f and V/f converters, direct type ADC ramp, tracking, dual slope, successive approximation and flash type multistage flash type ADCs, DVM and its design .

Subject	MODELING AND ANALYSIS OF ELECTRICAL MACHINES	Sub-code	20EEPEPEMA
Credits	03	L-T-P	3-0-0

Course outcomes:

CO1: Apply basic concepts of modeling for DC Machines, three phase induction machine and synchronous machines.

CO2: Model a single phase & three phase transformers, autotransformers and transmission line.

CO3: Carry out the dynamic performance analysis of synchronous machines.

Unit 1: Basic Concepts of Modeling: Basic two pole machine representation of commutator machines, 3-phase synchronous machine with and without damper bar and 3-phase induction machine, Kron's primitive machine-voltage, current and torque equations.

Unit 2: DC Machine Modeling: Mathematical model of separately excited DC motor-steady state and transient state analysis, sudden application of inertia load, transfer function of separately excited DC motor, mathematical model of dc series motor, shunt motor, linearization techniques for small perturbations.

Unit 3: Reference Frame Theory: Real time model of a two phase induction machine, transformation to obtain constant matrices, three phase to two phase transformation, power equivalence.

Dynamic Modeling of Three Phase Induction Machine: Generalized model in arbitrary frame, electromagnetic torque, derivation of commonly used induction motor models-stator reference frames model, rotor reference frames model, synchronously rotating reference frames model, equations in flux linkages, per unit model, dynamic simulation.

Unit 4: Small Signal Equations of the Induction Machine: Derivation of small signal equations of induction machine, space phasor model, DQ flux linkages model derivation, control principle of the induction motor.

Unit 5: Modeling of Synchronous Machines: Introduction, voltage equations and torque equation in machine variables, stator voltage equations in arbitrary and rotor reference frame variables, Park's

equations, torque equations in substitute variables, rotor angle and angle between rotors, per unit system, analysis of steady state operation.

Subject	POWER ELCTRONICS IN SMART GRID	Sub-code	20EEPEPEPS
Credits	03	L-T-P	3-0-0

Course outcomes:

CO1: Acquire in-depth knowledge about smart grid, power quality problems, high frequency AC power distribution platforms, distributed generation and their integration with existing grid and importance of energy storage system in smart grid.

CO2: Analyse process of installation and operation of different active power controllers in smart grid network.

CO3: Learn and explain in the form of presentation and report about different components and recent advancement in smart grid.

Unit 1: Introduction: Introduction to smart grid, electricity network, local energy networks, electric transportation, low carbon central generation, fundamental problems of electrical power systems, attributes of the smart grid, alternate views of a smart grid. Power quality and EMC, power quality issues, monitoring, legal and organizational regulations, mitigation methods, and EMC related phenomena in smart system.

Unit 2: High frequency AC Power Distribution Platforms: High frequency in space application, high frequency in telecommunications, high frequency in automotive and motor drives, high frequency in micro grids, future prospects.

Unit 3: Integration of Distributed Generation with Power System: Distributed generation past and future, interconnection with a hosting grid, integration and interconnection concerns, distributed generation contribution to power quality problems and current challenges, power injection principle, injection using static compensators and advanced static devices.

Unit 4: Active Power Controllers: Dynamic static synchronous controllers, D – STATCOM, Dynamic static synchronous series controllers, dynamic voltage restorer, AC/AC voltage regulators.

Unit 5: Energy Storage Systems: Introduction, structure of power storage devices, pumped – storage hydroelectricity, compressed air energy storage system, flywheels, battery storage, hydrogen storage, super conducting magnet energy storage, super capacitors, applications of energy storage devices.

ELECTIVE – II

Subject	EMBEDDED SYSTEM DESIGN	Sub-code	20EEPEPEES
Credits	03	L-T-P	3-0-0

Course outcomes:

CO1: Apply the basic concepts and design an embedded system for real time applications.

CO2: Evaluate and select a high performance processor to develop a real time system.

CO3: Present and prepare a technical report for a specific real time embedded system.

Unit 1: Introduction to Embedded System: An embedded system, processor, hardware unit, software embedded into a system, example of an embedded system, OS services, real time and embedded OS.

Unit 2: Processor and Memory Organization: Structural unit in a processor, processor selection for an embedded systems, memory devices, memory selection for an embedded system, allocation of memory to program segments and blocks, and direct memory accesses.

Unit 3: Real Time System: Types, real time computing, design issues, ARM system architecture, high performance processors - strong ARM processors, addressing modes, instruction set, and few basic assembly language programs.

Unit 4: Real Time Operating System: Fundamental requirements of RTOS, real time kernel, schedulers, various scheduling modules, latency (interrupt latency, scheduling latency and context switching latency), tasks, state transition diagram, task control block. Inter-task communication and synchronization of tasks.

Unit 5: Building real time applications.

Subject	CMOS VLSI DESIGN AND SYSTEM ON CHIP	Sub-code	20EEPEPECV
Credits	03	L-T-P	3-0-0

Course Outcomes:

CO1: Apply the basics of CMOS technology and its characterization and performance Estimation.

CO2: Analyze the design strategies and testing methods for CMOS sub-systems.

CO3: Identify various SoC design structures.

CO4: Realize SoC system design models in computation, co design and prepare a technical report.

Unit 1: INTRODUCTION TO CMOS CIRCUITS: MOS Transistors, MOS Transistors switches, CMCS logic circuit and System representations, MOS Transistor theory – Introduction MOS device design equation, the complementary CMOS inverter – DC characteristics, Static Load MOS inverters, the differential inverter, the transmission gate, Tri state inverter.

Unit 2: CIRCUIT CHARACTERISATION AND PERFORMANCE ESTIMATION & CMOS CIRCUIT AND LOGIC DESIGN: Introduction, Resistance estimation, Capacitance estimation, Inductance estimation, Switching characteristics of CMOS gate Transistor, Sizing, Power Dissipation, Sizing Routing conductors, Charge sharing, Design Margining, Reliability. CMOS Logic Gate design, Basic Physical Design of simple gate, CMOS Logic structures clocking strategies, I/O Structures, Low Power Design.

Unit 3: CMOS SYSTEMS DESIGN: Design Strategies CMOS chip Design options, Design Methods, Design Capture Tools, Design Verification Tools, Design Economics, and Data Sheets. CMOS Testing – Manufacturing Test Principles, Design Strategies for Test, Chip level Test Techniques, System Level Test Techniques.

Unit 4: INTRODUCTION to SoC: Introduction to SoC Design., Platform-Based SoC Design., Multiprocessor SoC and Network on Chip, Low-Power SoC Design.

Unit 5: SOC SYSTEM DESIGN: System Models, Validation and Verification, Hardware/Software Co-design Application Analysis.

Subject	ADVANCED CONTROL SYSTEM	Sub-code	20EEPEPEAC
Credits	03	L-T-P	3-0-0

Course outcomes:

CO1: Create state models for continuous and discrete time systems.

CO2: Identify appropriate techniques to analyze both continuous and discrete systems for controllability and observability

CO3: Apply relevant concepts to design continuous and discrete systems with state feedback to meet the specifications.

Unit 1: Digital Control Systems: Review of difference equations and Z - transforms, Z- transfer function (Pulse transfer function), Z - Transforms analysis, sampled data systems.

Unit 2: Stability analysis (Jury’s Stability Test and Bilinear Transformation), pulse transfer functions and different configurations for closed loop discrete-time control systems.

Unit 3: Modern Control Theory: State model for continuous time and discrete time systems, solutions of state equations (for both continuous and discrete systems), concepts of controllability and observability (for both continuous and discrete systems), pole placement by state feedback (for both continuous and discrete systems), full order and reduced order observers (for both continuous and discrete systems), dead beat control by state feedback.

Unit 4: Optimal control problems using state variable approach, state regulator and output regulator, concepts of model reference control systems, adaptive control systems and design.

Unit 5: Non Linear Control Systems: Common nonlinearities, singular points, stability of nonlinear systems - phase plane analysis and describing function analysis, Lyapunov’s stability criterion, Popov’s criterion.

INSTITUTION CORE COURSE

Subject	RESEARCH METHODOLOGY & IPR	Sub-code	20HSMCICRM
Credits	02	L-T-P	2-0-0

Course outcomes:

CO1: Able to write and present a substantial technical report/document

CO2: Able to demonstrate a degree of mastery over the area of specialization

Unit 1:

Meaning and sources of research problem, , Objectives and Characteristics of research – Errors in selecting research problem, Research methods Vs Methodology - Types of research-Criteria of good research – Developing a research plan.

Unit 2:

Investigations of a research problem - Selecting the problem - Necessity of defining the problem – Data collections-analysis- Importance of literature review in defining a problem - Survey of literature -Necessary instrumentations.

Unit 3:

How to write paper-conference articles-poster preparation, thesis report writing, inclusion of references, journal reviewing process, journal selection process, filling about journal template, developing effective research proposal-plagiarism-research ethics.

Unit 4:

Nature of Intellectual property, IPRs- Invention and Creativity - Importance and Protection of Intellectual Property Rights (IPRs) – procedure for grant of patents and patenting under PCT-types of patents-technological research and innovation- international cooperation on IP.

Unit 5:

A brief summary of : Patents-Copyrights-Trademarks, patent rights-licensing and transfer of technology-patent databases-case studies on IPR-Geographical indications-new developments in IPR-protection of IPR rights

II SEMESTER

Subject	AC AND DC DRIVES	Sub-code	20EEPEPCAD
Credits	04	L-T-P	3-0-1

Course outcomes:

CO1: Analyze and choose the appropriate converter topology for different AC-DC drives circuits.

CO2: Develop simulation models for AC-DC drives systems prescribed in the curriculum.

CO3: Apply design tools to conduct experiments, compare and analyze the hardware results with that of simulation results and prepare a technical report.

Unit 1: Electric Drives: Introduction – block diagram-classification of electrical drives-choice of electrical drives-fundamental torque equation- components of load torque- steady state stability.

Unit 2: DC Drives: Single Quadrant Drive: 1-Phase semi and half wave converter drives, Two quadrant Drive: 1-phase and 3-phase full converter drive.

Unit 3: Two and Four Quadrant drive: 1-phase and three- phase dual converter drive, different braking methods and closed loop control of DC drives.

Unit 4: AC Drives: Voltage and current source inverter - inverter control-six step and PWM operation, Control of Induction motor drive -V/f and field oriented control – direct and indirect vector control, voltage and current source inverter fed induction motor drives, stator and rotor voltage control methods, slip energy recovery drives.

Unit 5: Closed Loop Control of AC Drives: Stator voltage control, V/f control, Slip regulation, speed control of static Kramer's drive, current control, brushless DC motor, stepper motor and variable reluctance motor drives, Applications of AC drives, Synchronous motor drives.

Lab experiments:

Experimental/Simulation studies on

- Converter fed separately excited DC drives
- Chopper drives
- Speed control of 3 phase Induction motor
- Chopper/Inverter Circuit design using TL 494 CHIP.
- Chopper/Inverter Circuit design using SG 3524 CHIP.
- Recent IEEE paper review, analysis and simulation study of concept presented in the paper followed by presentation and report submission.

Subject	SWITCHED MODE POWER CONVERSION	Sub-code	20EEPEPCSM
Credits	04	L-T-P	3-0-1

Course outcomes:

CO1: Analyse and evaluate the performance of basic and derived switched mode power converters.

CO2: Design magnetic components for high frequency SMPS and submit a report.

CO3: Conduct experiment/simulation studies on basic converters and derived converters for CCM/DCM operation and prepare a technical report.

Unit 1: DC – DC Converters (Non isolated Converters): Principle of operation and analysis of buck converter analysis, inductor current ripple and output voltage ripple, capacitor resistance effect, synchronous rectification, design considerations, buck converter for discontinuous current operation, principle of operation and analysis of buck-boost converter analysis, inductors current ripple and output voltage ripple, design considerations, buck-boost converter for discontinuous current operation, principle of operation and analysis of CUK converter , inductor current ripple and output voltage ripple, capacitor resistance effect, design considerations, single ended primary inductance converter (SEPIC).

Unit 2: Isolated Converters: Introduction, transformer models, principle of operation and analysis of fly back converter-continuous and discontinuous current mode of operation, design considerations, principle of operation and analysis of forward converter, design considerations, double ended(Two switch) forward converter, principle of operation and analysis of push-pull converter, design considerations, principle of operation and analysis of full bridge and half-bridge DC-DC converters, design considerations, current fed converters, multiple outputs.

Unit 3: Control of DC-DC Converter: Modeling of DC-DC converters, power supply control, control loop stability, small signal analysis, switch transfer function, filter transfer function, PWM transfer function, Type-2 error amplifier with compensation, design, Type-3 error amplifier with compensation, design.

Unit 4: Resonant Converters: Introduction, resonant switch ZCS converter, principle of operation and analysis, resonant switch ZVS converter, principle of operation and analysis, series resonant inverter, series resonant DC-DC converter, parallel resonant DC-DC converter, series- parallel resonant DC-DC converter, resonant converters comparison, resonant DC link converter.

Unit 5: Introduction on design of Inductors and transformers: Design of inductor for Buck converter and transformer design for Forward converter as case studies.

Design of power supplies to meet the specifications: Input filter, bulk capacitor and hold-up time, Limiting in-rush current, ESR considerations, EMI considerations

Lab experiments:

Experimental/Simulation studies on

- Buck converter
- Boost converter
- Buck/Boost converter for CCM & DCM mode
- Flyback and forward converter
- Resonant converter

Subject	APPLICATION OF POWER ELECTRONICS FOR POWER TRANSMISSION AND DISTRIBUTION	Sub-code	20EEPEPCAP
Credits	04	L-T-P	3-1-0

Course outcomes:

CO1: Design, model and analyse the controllers for various FACTS controllers and HVDC systems.

CO2: Design and analyze various types of filters for HVDC and HACTS.

CO3: Carry out simulation/activities on FACTS controllers or HVDC systems and prepare technical report.

Unit 1: Introduction: Basics of power transmission networks - control of power flow in AC - transmission line-flexible AC transmission system controllers – application of FACTS controllers in distribution systems. Analysis of uncompensated AC Line – passive reactive power compensation - compensation by a series capacitor connected at the midpoint of the line; shunt compensation connected at the midpoint of the line; comparison between series and shunt capacitor.

Static Var Compensator: Analysis of SVC - Configuration of SVC- SVC Controller – voltage regulator design.

Unit 2 : Static Synchronous Compensator (STATCOM): Introduction - principle of operation of STATCOM - a simplified analysis of a three phase six pulse STATCOM; analysis of a six pulse VSC using switching functions; multi-pulse converters control of type 2 converters; control of type I Converters - Multilevel voltage source converters; Applications of STATCOM.

Unified Power Flow Controller (UPFC) – Introduction, Operation of a UPFC, Control of series and shunt converters.

Unit 3: Custom Power Devices: Introduction, Active filters.

Dynamic Voltage Restorer: Introduction, Dynamic voltage restoration, Open loop controller for DVR.

Load Compensation and DSTATCOM: Introduction, Compensation using DSTATCOM for a three phase three wire system, Expression for current and power components using Phase coordinates.

Unit 4: DC Power Transmission Technology: Introduction, comparison with AC transmission, application of DC transmission, description of DC transmission system, modern trends in DC transmission, operating problems.

HVDC Converters: Introduction to Line commutated converter, analysis of 6 pulse Graetz bridge converter without overlap, effect of smoothing reactor, Analysis of 6 pulse converter in two and three, and three and four valve conduction modes, Analysis of a twelve pulse converter.

Voltage sourced converter based HVDC: Two and Three level voltage source converters, Pulse Width Modulation, HVDC transmission based on Voltage Source Converters.

Unit 5: Converter and HVDC system control: Principles of DC link control, converter control characteristics, firing angle control, current and extinction angle control, Power control, Higher level controllers, Control of voltage source converter.

Harmonics and filters: Characteristics and Non characteristics harmonics (Excluding derivation), Design of AC filters: criteria of design, single tuned passive AC filter, passive DC filters.

Multi Terminal DC Systems: Introduction, applications, types.

Basic concepts of **Multi-infeed DC systems**

Choice: Unit-II and Unit-V

ELECTIVE – III

Subject	POWER ELECTRONICS SYSTEM DESIGN USING ICs	Sub-code	20EEPEPEPD
Credits	03	L-T-P	3-0-0

Course outcomes:

CO1: Design high performance power electronic circuits using different ICs for various applications.

CO2: Design a Power Electronic System using Microcomputer and DSP Control.

CO3: Think laterally and originally to solve power electronic circuits, and evaluate problems for Practical switching power supplies and prepare a report.

Unit 1: Switching Regulator Control Circuits: Introduction, isolation techniques of switching regulator systems, PWM systems.

Unit 2: Switching Power Supply Ancillary, Supervisory & Peripheral Circuits and Components: Introduction, Opto-couplers, self-biased techniques used in primary side of reference power supplies, Soft/Start in switching power supplies, current limit circuits, over voltage protection, AC line loss detection, Implementation of different gating circuits.

Unit 3: Microcontroller and Digital ICs for control of Power Electronic Systems: Microcomputer control of Power Electronic Systems, Digital vs Analog control, Real time control using Microcomputer, Advanced Microprocessor and DSP based control of P. E Systems, ASICs for control, Digital control using FPGA & PLDs, Design of Microprocessor based Control Systems, Application examples.

Unit 4: Commercial PWM Control ICs and their Applications: TL 494 PWM Control IC, UC 1840 Programmable off line PWM controller, UC 1524 PWM control IC, UC 1846 current mode control IC, UC 1852 resonant mode power supply controller.

Unit 5: Programmable Logic Controllers (PLC): Basic configuration of a PLC, Programming using Ladder diagram for PLC, program modification, power plant control using PLCs.

REFERENCE BOOKS:

Subject	POWER QUALITY ENHANCEMENT USING CUSTOM POWER DEVICES	Sub-code	20EEPEPEPQ
Credits	03	L-T-P	3-0-0

Course outcomes:

CO1: Analyze the Power quality issues and concerns of the country.

CO2: Identify the type of Power quality problems with reference to IEEE/IET standards.

CO3: Analyze, evaluate and realize the control techniques for power quality problems.

CO4: Decide on choosing the necessary monitoring equipment and mitigation techniques.

Unit 1: Introduction and Characterization of Electric Power Quality: Electric Power Quality, Power Electronic applications in Power Transmission Systems, Power Electronic applications in Power Distribution Systems. Power Quality terms and Definitions, Power Quality Problems.

Analysis and Conventional Mitigation Methods: Analysis of Power Outages, Analysis of Unbalance, Analysis of Distortion, Analysis of Voltage Sag, Analysis of Voltage Flicker, Reduced Duration and Customer impact of Outages, Classical Load Balancing Problem, Harmonic Reduction, Voltage Sag or Dip Reduction.

Unit 2: Custom Power Devices: Introduction, Utility-Customer Interface, Custom Power Devices, Custom Power Park, Status of Application of CP Devices, Closed-Loop Switching Control, Second and higher order Systems.

Unit 3: Solid State Limiting, Breaking and Transferring Devices: Solid State Current Limiter, Solid State Breaker, Issues in Limiting and Switching operations, Solid State Transfer Switch, Sag/Swell Detection Algorithms.

Unit 4: Generation of Reference Parameter : Generating Reference Currents Using Instantaneous PQ Theory, Generating reference currents using instantaneous Symmetrical Components, General Algorithm for generating reference currents, Generating Reference currents when the Source is Unbalanced.

Unit 5: Active Power Filters: Series Active Filter, Shunt Active Filter, UPQC Configurations, Right-Shunt UPQC Characteristics, Left-Shunt UPQC Characteristics, Structure and Control of Right-Shunt UPQC, Structure and Control of Left-Shunt UPQC.

REFERENCE BOOKS:

Subject	PWM CONVERTERS AND APPLICATIONS	Sub-code	20EEPEPEPW
Credits	03	L-T-P	3-0-0

Course outcomes:

CO1: Develop and analyze various PWM Techniques for converters.

CO2: Analyze & estimate the various losses in converters.

CO3: Model the PWM Converters and Induction motor drives.

CO4: Apply various compensation techniques for the converters.

Unit 1: AC/DC and DC/AC Power Conversion: Overview of applications of voltage source converters.

Unit 2: PWM Techniques: Pulse modulation techniques for I – phase bridges, bus clamping PWM, space vector based PWM, advanced PWM techniques.

Unit 3: Loss Calculations: Practical devices in converters, calculation of switching and conduction losses, compensation for dead time and DC voltage regulation.

Unit 4: Modeling: Dynamic model of PWM converters; constant V/F induction motor drives; estimation of current ripple and torque ripple in inverter fed drives.

Unit 5: Converters with Compensation: Line-side converters with power factor compensation, reactive power compensation, harmonic current compensation.

REFERENCE BOOKS:

ELECTIVE-IV

Subject	POWER QUALITY ISSUES IN INDUSTRIAL APPLICATIONS OF POWER ELECTRONICS	Sub-code	20EEPEPE
Credits	03	L-T-P	3-0-0

Course outcomes:

At the end of the course students will have the ability to:

CO1: Understand the factors affecting the power quality.

CO2: Understand and analyse the issues of high voltage stresses in power electronic environment

CO3: Analyze the effect of Harmonics and power quality issues in rotating machines.

Course Description: This course deals with the understanding of power quality issues that any power electronic system is subjected to. Effect of voltage stress, harmonics under loading conditions on the system and solid insulation in the rotating machines and the capacitors used in multilevel inverters are also analysed. Student is equipped with a holistic approach to analyse the power electronic system.

Unit 1: Power Quality- Origin and Impact on Power Electronics circuits: Concept of power quality, Distributed generation, impact of distributed generation on current and voltage quality, tripping of generator units. Power Quality issues and concerns of the country. Voltage frequency variations, power balance, power-frequency control, spinning reserve, choice of power set-point, sharing of load, behavior consequences of frequency variations, time deviation of clocks, variations in motor speed, variations in flux, risk of under frequency tripping, rate of change of frequency, measurement examples.

Unit 2: Power Quality Issues – Classification: Events and variation, Power quality monitoring. Overview of power quality standards, compatibility between equipment and supply, normal events, abnormal events, transients, long duration voltage variations, short duration voltage variations, voltage imbalance, waveform distortion, consequences of waveform distortion, harmonic distortion, voltage versus current distortion, harmonics versus transients, power system quantities under non sinusoidal conditions, active reactive and apparent power, displacement power factor and true power factor, harmonic phase sequences, triple harmonics, harmonic indices, total harmonic distortion and total demand distortion.

Unit 3: Voltage stresses and their consequences

Types of stresses, causes of voltage stress in a power electronic environment. Effect of voltage sag and swell and consequent temperature rise, impact on the health of solid insulation, voltage stress on the capacitors in multi-level inverters. Loading conditions, Power Quality Issues in Rotating Machines.

Unit 4: Effects of Harmonics: Effect on capacitors, Effect on transformers, impact on motors, Harmonic sources from commercial loads, single phase power supplies, fluorescent lighting, adjustable -speed drives for HVAC and elevators, Wiring and grounding, reasons for grounding, typical wiring and grounding problems, solutions to a few wiring and grounding problems. Passive and Active power filters (qualitative approach only).

Unit 5: Power Quality Measurements: Power quality measurement equipment: types, wiring and grounding testers, multimeters, digital cameras, oscilloscopes, disturbance analyzers spectrum and harmonic analyzers, flicker meters, smart power quality monitors, transducer requirements.

TEXT BOOKS:

Subject	ELECTRO MAGNETIC COMPATIBILITY	Sub-code	20EEPEPEEM
Credits	03	L-T-P	3-0-0

Course outcomes:

CO1: Analyse the fundamentals and reasons for noise in Analog electronics, Power electronics and Digital electronics circuit.

CO2: Design and develop filters for Analog electronics, Power electronics and Digital circuits for reduction of noise.

CO3: Design the various types of grounding systems and get familiarised with handling electro static discharge systems, testing standards and Regulations.

CO4: Acquire knowledge about testing standards and regulations.

Unit 1: Review of EMI Theory: Sources of EMI, noise pick up modes and reduction techniques for analog circuits.

Unit 2: Emissions and Reduction Techniques: Use of co-axial cables and shielding of signal lines, conducted and radiated noise emission in power electronic equipment and reduction techniques.

Unit 3: EMI induced failure mechanisms for power electronic equipment, EMC in design of digital circuits.

Unit 4: Electrostatic Discharge: ESD and switching interference reduction, susceptibility aspects of power electronic and digital equipment.

Unit 5: Shielding of electronic equipment.

REFERENCE BOOKS:

Subject	ELECTRIC VEHICLES	Sub-code	20EEPEPEEV
Credits	03	L-T-P	3-0-0

Course outcomes:

CO1: Acquire in depth knowledge of the electric vehicle system and its components and various modes of operation.

CO2: Estimate and analyze the performance parameters including energy consumption, tractive effort etc. associated with an electric vehicle under different conditions of operation and also various types of electric drive systems suitable for electric vehicle operation.

CO3: Design a battery operated electric vehicle for a given specification.

CO4: Prepare and present a technical report on modeling and operation of Electric vehicles.

Unit 1: Environmental impact and history of modern transportation: Air pollution, global warming, importance of different transportation, history of electric vehicles.

Unit 2: Fundamentals of vehicle propulsion and break: General description of vehicle movement, Vehicle resistance dynamic equation, tire ground adhesion, and maximum tractive effort. Power train tractive effort and vehicle speed, vehicle power plant and transmission characteristics, vehicle performance, brake performance.

Unit 3: Electric Vehicles and Electric propulsion system: Configuration of EVs, performance of EVs, tractive effort in normal driving, energy conversion. DC motor drives, permanent magnet BLDC motor drives, SRM drives.

Unit 4: Energy storages for electric vehicles: Electrochemical batteries, ultra capacitors, ultra high speed flywheels, hybridization of energy storage.

Unit 5: Fundamentals of regenerative braking: Braking energy consumed in urban driving, Braking energy versus vehicle speed, braking power, vehicle speed, vehicle deceleration rate.

REFERENCE BOOKS:

1. Mehrdad Ehsani, Yimin Gao, Ali Emadi, “Modern Electric, Hybrid Electric and Fuel Cell Vehicles; Fundamentals Theory and Design”, Second Edition, CRC Press.
2. Iqbal Husain, “Electric and Hybrid Vehicles; Design Fundamentals”, CRC Press.

INSTITUTION ELECTIVE

Subject	RENEWABLE ENERGY & SOLAR PHOTOVOLTAICS SYSTEM	Sub-code	20EEPEIERE
Credits	04	L-T-P	4-0-0

Course outcomes:

CO1: Acquire in depth knowledge about different types of renewable & non-renewable sources, the physics of photovoltaic system, solar thermal systems, application of solar energy systems and MPPT concept.

CO2: Apply knowledge of mathematics to solve problems related to solar radiation & measurement, basic sun earth angles, and economic aspects of PV systems.

CO3: Design of charge controller, cells & modules for roof top and grid connected PV systems.

Unit 1: Introduction: Energy sources and their availability, commercial or conventional energy sources- thermal, hydro and nuclear, renewable energy sources, prospects of renewable energy sources.

Unit 2: Physics of Photovoltaic Systems: Introduction, p-n junction, photo voltaic effect, classification of solar cells, Model of PV cells; equivalent circuit, I-V and P-V characteristics, solar cell efficiency, fill factor, shading effect on cell and module, effect of temperature on PV cell characteristics.

Unit 3: Solar energy conversion: Solar radiation and measurements, solar constant, basic sun earth angles-definitions and their representation, solar thermal system, physical principles of the conversion of solar radiation into heat, flat plate collectors, energy balance equation and collector efficiency.

Unit 4: Solar electric system: Charge controllers, Maximum power point tracking, design of roof top solar PV systems, inverter types, standalone photo voltaic systems, solar cell manufacturing process, thin film solar cells and their advantages, economic analysis of PV systems.

Unit 5: Application of solar energy and photovoltaic: Solar water pumping system, solar water heating, rural electrification, grid integration, different topologies for single phase and three phase grid integration, future developments.

REFERENCE BOOKS:

1. G.D. Rai, “Non-Conventional Energy Sources”, Khanna publishers.
2. Chenming Hu and R.M. White, “Solar Cells from Basics to Advanced Systems”, McGraw Hill Book Co.
3. B.H. Khan, “Non-Conventional Energy Resources”, Tata MsGraw Hill Education Private Limited.

Subject	MICRO & SMART SYSTEMS	Sub-code	20EEPEIEMS
Credits	04	L-T-P	4-0-0

Course outcomes:

CO1: Understand the concept of sensors and actuators, micromachining technologies, deposition techniques, lithography and integration of microsystems.

CO2: Acquire in depth knowledge on characterization techniques like SEM, XRD and TEM and further analyse different electronic circuits used to control micro systems.

CO3: Demonstrate in the form of presentation and report about the effects of scaling in different domain in Micro Systems.

Unit 1: Introduction and Scaling effects in microsystems: Review of material science, Microsystem versus MEMS, smart materials, structures and systems, integrated microsystems, applications of smart materials and microsystems. Scaling in the mechanical domain, electrostatic domain, magnetic domain, thermal domain, scaling in diffusion, scaling in fluids, scaling effects in the optical domain, scaling in biochemical phenomena.

Unit 2: Micromachining Technologies: Silicon as a material for micromachining, vacuum pumps, thin film deposition, ion implantation, lithography, etching, silicon micromachining, specialized materials for micro systems, advanced processes for micro fabrication.

Unit 3: Micro Sensors, Actuators, Systems and Smart Materials: Silicon Capacitive Accelerometer, piezoresistive pressure sensor, conductometric gas sensor, electrostatic comb drive, magnetic microrelay, portable blood analyzer.

Unit 4: Characterization techniques: Introduction, film thickness, scanning electron microscopy (SEM), transmission electron microscopy (TEM), X-Ray diffraction (XRD), X-ray energy dispersive analysis (EDX).

Unit 5: Electronic Circuits and Control for Micro and Smart Systems: Practical signal conditioning circuits for microsystems, circuits for conditioning sensed signals, introduction to control theory, implementation of controllers. Integration of microsystems and microelectronics, microsystems packaging, case studies of integrated microsystems.

REFERENCE BOOKS:

3. MEMS Lecture Series (CDS) by Shanthiram Kal.

III SEMESTER

Subject	PROJECT WORK 1(I- PHASE)	Sub-code	20EEPEPCP1
Credits	8	L-T-P	0-0-8

Course outcomes:

CO1: Carry out literature survey from reputed journal/conference publications, and formulate a complex engineering problem.

CO2: Apply the fundamental knowledge of mathematics, engineering and Power Electronics principles in design of solutions or system components.

CO3: Identify, Select, and apply a suitable engineering/IT tool in modeling/data interpretation /analytical studies, conduct experiments leading to a logical solution.

CO4: Design a system/system component, simulate and test its functioning as a solution to a complex engineering problem.

CO5: Prepare a technical report and present the work carried out before the expert committee.

CO6: Communicate effectively the results of publication in a reputed journal/conference.

Subject	INTERNSHIP	Sub-code	20EEPEPCIN
Credits	10	L-T-P	0-0-10

Course outcomes:

CO1: Get an insight into the company profile and understand the organizational structure.

CO2: Apply and correlate theory and practice.

CO3: Communicate effectively regarding complex Engineering activities.

CO4: Demonstrate knowledge and understanding of Engineering & Management principles of the company.

CO5: Engage in life-long learning with a commitment to improve knowledge and competence continuously.

CO6: Acquire professional & intellectual integrity and its impact on the society.

CO7: Prepare and present a technical report for the Internship carried out.

ELECTIVE - V

Subject	INDUSTRIAL SAFETY	Sub-code	20EEPEPEIS
Credits	04	L-T-P	4-0-0

Unit 1: Industrial safety: Accident, causes, types, results and control, mechanical and electrical hazards, types, causes and preventive steps/procedure, describe salient points of factories act 1948 for health and safety, wash rooms, drinking water layouts, light, cleanliness, fire, guarding, pressure vessels, etc, Safety color codes. Fire prevention and firefighting, equipment and methods.

Unit 2: Fundamentals of maintenance engineering: Definition and aim of maintenance engineering, Primary and secondary functions and responsibility of maintenance department, Types of maintenance, Types and applications of tools used for maintenance, Maintenance cost & its relation with replacement economy, Service life of equipment.

Unit 3: Wear and Corrosion and their prevention: Wear- types, causes, effects, wear reduction methods, lubricants-types and applications, Lubrication methods, general sketch, working and applications, i. Screw down grease cup, ii. Pressure grease gun, iii. Splash lubrication, iv. Gravity lubrication, v. Wick feed lubrication vi. Side feed lubrication, vii. Ring lubrication, Definition, principle and factors affecting the corrosion. Types of corrosion, corrosion prevention methods.

Unit 4: Fault tracing: Fault tracing-concept and importance, decision tree concept, need and applications, sequence of fault finding activities, show as decision tree, draw decision tree for problems in machine tools, hydraulic, pneumatic, automotive, thermal and electrical equipment's like, I. Any one machine tool, ii. Pump iii. Air compressor, iv. Internal combustion engine, v. Boiler, vi. Electrical motors, Types of faults in machine tools and their general causes.

Unit 5: Periodic and preventive maintenance: Periodic inspection-concept and need, degreasing, cleaning and repairing schemes, overhauling of mechanical components, overhauling of electrical motor, common troubles and remedies of electric motor, repair complexities and its use, definition, need, steps and advantages of preventive maintenance. Steps/procedure for periodic and preventive maintenance of: I. Machine tools, ii. Pumps, iii. Air compressors, iv. Diesel generating (DG) sets, Program and schedule of preventive maintenance of mechanical and electrical equipment, advantages of preventive maintenance. Repair cycle concept and importance.

REFERENCE BOOKS:

1. Maintenance Engineering Handbook, Higgins & Morrow, Da Information Services.
2. Maintenance Engineering, H. P. Garg, S. Chand and Company.
3. Pump-hydraulic Compressors, Audels, Mcgrew Hill Publication.
4. Foundation Engineering Handbook, Winterkorn, Hans, Chapman & Hall London.

Subject	COST MANAGEMENT OF ENGINEERING PROJECTS	Sub-code	20EEPEPECE
Credits	04	L-T-P	4-0-0

Unit 1: Introduction and Overview: Strategic Cost Management Process Cost concepts in decision-making; relevant cost, Differential cost, Incremental cost and Opportunity cost. Objectives of a Costing System; Inventory valuation; Creation of a Database for operational control; Provision of data for Decision-Making. Project: meaning, Different types, why to manage, cost overruns centres, various stages of project execution: conception to commissioning. Project execution as conglomeration of technical and nontechnical activities.

Unit 2: Detailed Engineering activities: Pre project execution main clearances and documents Project team: Role of each member. Importance Project site: Data required with significance. Project contracts. Types and contents. Project execution Project cost control. Bar charts and Network diagram. Project commissioning: mechanical and process, Cost Behaviour and Profit Planning Marginal Costing; Distinction between Marginal Costing and Absorption Costing; Break-even Analysis, Cost-Volume-Profit Analysis. Various decision-making problems.

Unit 3: Standard Costing and Variance Analysis. Pricing strategies: Pareto Analysis. Target costing, Life Cycle Costing. Costing of service sector. Just-in-time approach, Material Requirement Planning, Enterprise Resource Planning, Total Quality Management and Theory of constraints.

Unit 4: Activity-Based Cost Management, Bench Marking; Balanced Score Card and Value-Chain Analysis. Budgetary Control; Flexible Budgets; Performance budgets; Zero-based budgets. Measurement of Divisional profitability pricing decisions including transfer pricing.

Unit 5: Quantitative techniques for cost management, Linear Programming, PERT/CPM, Transportation problems, Assignment problems, Simulation, Learning Curve Theory.

REFERENCE BOOKS:

1. Cost Accounting A Managerial Emphasis, Prentice Hall of India, New Delhi
2. Charles T. Horngren and George Foster, Advanced Management Accounting
3. Robert S Kaplan Anthony A. Alkinson, Management & Cost Accounting
4. Ashish K. Bhattacharya, Principles & Practices of Cost Accounting A. H. Wheeler publisher
5. N.D. Vohra, Quantitative Techniques in Management, Tata McGraw Hill Book Co. Ltd.

Subject	DSP APPLICATIONS TO DRIVES	Sub-code	20EEPEPEDS
Credits	04	L-T-P	4-0-0

Course outcomes:

CO1: Identify the functionality of TMS320LF2407 DSP Controller.

CO2: Analyze various DSP based DC-DC Converters.

CO3: Design and develop DSP based control for various motors.

Unit 1: Introduction To Digital Controller: Digital Signal Controller (A micro-controller with a DSP engine): Comparison of microprocessor and digital signal controller (Block diagram approach), TMS320F2x family,

Architecture of TMS320F28335, Functional Units, pipelining processing of instructions, memory map and code security modules

Unit 2: Numbering Systems: Fixed and Floating point Formats,

Digital Input/Output: GPIO input qualifications and Registers. Clock Modules, System Control and Status Register

Interrupt: Interrupt Sources, Core Interrupt Lines, Maskable Interrupts, Peripheral Interrupt Expansion Unit, Hardware Interrupt Response, CPU Timers

PWM, Capture and Encoder Units: Block Diagram, PWM Time base units, Timer Operating Modes, Time Base Registers, PWM Compare Units, PWM Action Qualification Unit, Dead Band Module, Capture Module, Enhanced QEP Module

Unit 3: ADC Module: ADC Module Overview, Operating Modes, ADC Conversion Time, ADC Register Block

Communication Modules: SCI, SPI, I2C and CAN Modules: Data Formats, Register Sets and Data Transfer

Unit 4: Multi Channel Buffered Serial Port (McBSP): Block Diagram, Data Frame Diagram, Companding Data. Clocking, Transmission and Receiving, Module Registers

Flash Programming: Flash Memory Sectors, Configuration Registers, Flash Programming Procedure

BOOT-ROM and BOOT Loader: Memory Map, Timeline, Boot Loader data stream, Init Boot Assembly Function

Flash Application Program Interface (API): API Fundamentals, General Guidelines, FLASH-API checklist

Unit 5:

Digital Motor Control: Motor Control Principles, Field Oriented Control (FOC), F28335 features for motor control, Example of control of PMSM Motor

Digital Power Supply: Introduction to digital power supply design, driving power stages with PWM waveforms, Controlling power stage with feedback, Tuning the loop for good transient response

IV SEMESTER

Subject	PROJECT WORK (FINAL PHASE)	Sub-code	20EEPEPCP2
Credits	20	L-T-P	0-0-20

Course outcomes:

CO1: Apply the fundamental knowledge of mathematics, engineering and Power Electronics principles in design of solutions or system components.

CO2: Identify, Select, and apply a suitable engineering/IT tool in modeling/data interpretation/analytical studies, conduct experiments leading to a logical solution.

CO3: Design a system/system component, simulate and test its functioning as a solution to a complex engineering problem.

CO4: Develop a prototype model for the simulated work.

CO5: Communicate effectively the work carried out before the expert committee.

CO6: Develop good technical report.

CO7: Publish the results in a reputed International IEEE conference/journal.

Subject	TECHNICAL SEMINAR	Sub-code	20EEPEPCTS
Credits	02	L-T-P	0-0-2

Course outcomes:

CO1: Carry out literature survey and choose a relevant topic reported in recent IEEE conference publications / IEEE transactions in the domain of Power Electronics

CO2: Simulate and analyze the results reported in the selected paper.

CO3: Communicate effectively before the expert panel and develop Technical reports.

CO4: Respond to the Queries raised by the Evaluation Committee and audience.
